Front-end Test

Questionnaire

Create a JavaScript web app which allows an admin to input questions and multiple choice answers such as:

Sample Input

```
Question: [_____]
Choices: [_____]
```

Sample Output

```
How are you feeling today?
[  ] not well
[  ] well
[  ] good
[  ] great
```

Create an `/admin` route for questions and choices to be entered. The **Question** should be a textarea. Feel free to implement the **choices** UI as you deem adequate. Admin should be able to add multiple questions and choices.

Create a `/poll` route for questions to be displayed, filled and submitted in a form. **Choices** should be radio buttons for simplicity. Each form submission should have the question and selected choice stored and retained even after closing the browser via the `/results` route. User must select a choice for each question in order to successfully submit the form. Display a message to inform the user on form submission success and/or failure.

Create a `/results` route where submissions can be viewed.

We expect to be able to run the following command and your results should load on browser at `http://localhost:8080` (/poll, /admin, /results):

```
npm install && npm start
```

Additional considerations such as design, authentication, and framework/libraries are entirely within your discretion and not required. Please send us your zipped code directory excluding the /node_modules directory.
